PROFESSIONAL SUMMARY

High-Velocity Full-Stack Systems Engineer and FinTech Architect with a foundational degree in Mechanical Engineering from Obafemi Awolowo University (OAU). Defined by exceptional shipping speed and physical systems rigor—diagnosing friction points, concurrency bottlenecks, and strict fail-safes. Over the past year, independently designed, architected, and shipped **5 production-grade platforms** spanning high-frequency algorithmic trade routing (73+ concurrent WebSocket feeds at <100ms SLA), hyperlocal merchant logistics with instant split-payment escrow, browser-native WebGL 3D animation pipelines, and cloud FFMPEG media transcoding. Fully proficient across TypeScript, Next.js, Python (FastAPI/asyncio), and PostgreSQL with strict ACID row-level locking.

TECHNICAL PROFICIENCIES

Languages: TypeScript, Python (3.11/3.12), JavaScript (ESNext), SQL, C (FFI), HTML5/CSS3

Full-Stack & Web: Next.js, React, Tailwind CSS, Node.js, FastAPI, REST APIs, WebSockets

Databases & Concurrency: PostgreSQL (Row-Level Locking, PLpgSQL), Supabase, Redis, ACID Ledgers

FinTech & Payments: Paystack Split Payment API, Escrow Logic, Deriv WebSockets, MetaTrader C Bridges

3D & Media Pipelines: Three.js (WebGL), Canvas API, Cloud FFMPEG Transcoding, Audio Normalization

Cloud & DevOps: Docker, Cloud Run, Vercel, Google Cloud Storage, Git/GitHub Actions, CI/CD, Bash

PRODUCTION SYSTEMS & TECHNICAL TRACK RECORD

Lead Systems Architect & Technical Founder

2026 – Present · Independent Production Deployments

Architected, engineered, and deployed multiple live commercial and algorithmic platforms with zero external engineering assistance:

Chopos OS · Hyperlocal Logistics & Merchant Operating System — 2026 · Production System

- Architected a high-concurrency merchant ordering and delivery operating system engineered to eliminate vendor payout delays, order disputes, and high marketplace commission overhead.
- Integrated **Paystack Subaccount Split API** for atomic escrow settlement, instantaneously splitting customer transactions so food vendors receive payouts on order confirmation and dispatch couriers get paid upon verified physical handover.
- Engineered strict PostgreSQL row-level locks (`SELECT ... FOR UPDATE`) on inventory ledgers and active carts, achieving **100% elimination of double-spending** and inventory contention during flash demand spikes.
- Constructed a sub-second Kitchen Display System (KDS) relay over WebSockets that reduced kitchen order acknowledgment latency from several minutes to **under 3 seconds**.

ICT Flux · Algorithmic Quant Trading Platform (ictflux.app) — 2026 · Live Platform

- Architected and deployed an institutional-grade quantitative trading platform streaming **73+ concurrent live WebSocket feeds** (Forex, US Equities, Deriv Synthetics) with continuous zero-lookahead algorithmic event routing.
- Engineered low-level C FFI bindings directly interfacing Python asyncio models with MetaTrader (MT4/MT5) terminals, achieving **<100ms execution latency** under severe market volatility.
- Authored automated Smart Money Concepts (SMC) algorithmic matrices (Fair Value Gaps, Liquidity Sweeps, SMT divergence guards), maintaining strict automated risk parameters and dynamic trailing stops.
- Automated managed client accounts via Deriv WebSockets under a transparent 5%–10% monthly performance fee model, systematically eliminating emotional manual trading errors.

ToonForge & Video Assembler SaaS · Generative AI 3D Studio & Cloud Transcoder — 2026 · Cloud Suite

- Engineered **ToonForge**, an in-browser 3D animation workspace utilizing Three.js (WebGL) and Claude/Gemini AI APIs, allowing animators to produce multi-shot episodic scripts and automated phoneme lip-sync without expensive desktop 3D software.

- Developed **Video Assembler SaaS**: built a 700KB+ TypeScript multi-track timeline engine supporting multi-layer compositing, automated clipping, -14 LUFS broadcast audio leveling, and cloud FFMPEG rendering.
- Configured cloud storage queues using Google Cloud Storage and distributed worker nodes, reducing cloud transcoding and export times by **over 45%**.

Motion OAU & Enterprise Platforms · Geospatial Campus Transit & Business Systems 2025 – 2026

- Engineered **Motion OAU**, a geospatial campus network integrating Leaflet GPS tracking, Supabase real-time pub/sub, and Haversine shuttle batching to coordinate transit routes and secure night walking corridors for university students.
- Delivered custom enterprise booking platforms and ERP portals (School Portal OS, Biz Booking Engine) featuring role-based access control (RBAC), multi-tenant billing, and automated invoice generation.

EDUCATION & ENGINEERING FOUNDATION

Bachelor of Science (B.Sc.) in Mechanical Engineering Obafemi Awolowo University (OAU)

Ile-Ife, Nigeria

Relevant Engineering Rigor: Dynamic Systems Modeling, Fluid Mechanics & Heat Transfer, Finite Element Analysis (FEA), Numerical Methods, Computational Control Systems. Applies physical system analysis—stress limits, equilibrium states, friction reduction, and feedback loops—directly to modern distributed software engineering.
